

Analytic Trail 2

Question: What insights can be gained by looking at gapminder data for countries involved in the conflicts?

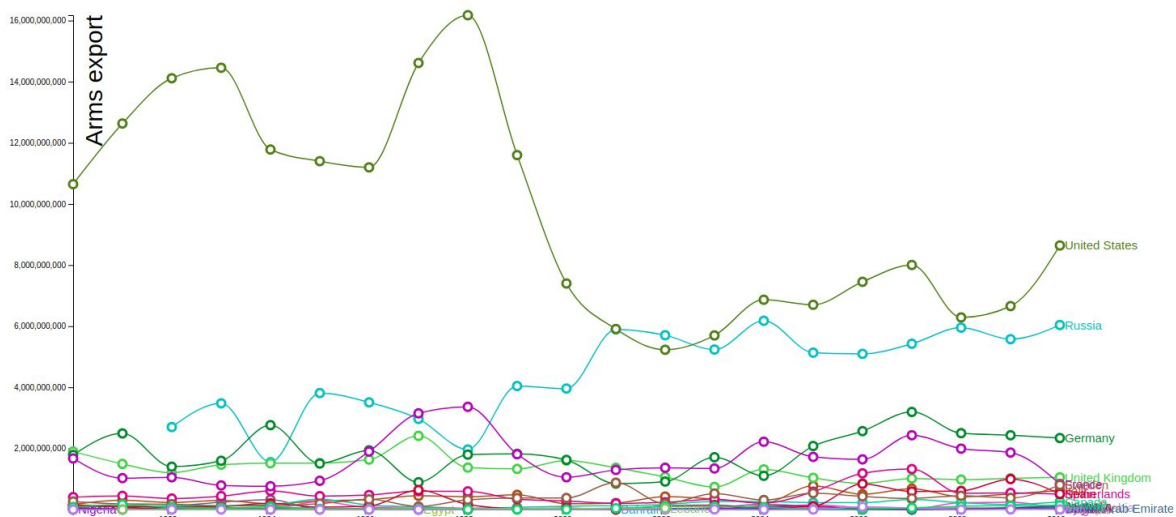

To increase the amount of data extracted I look at the Military Intervention against ISIL (involving most countries). Starting by Aid Received

Military intervention against ISIL (2014 -)

We see that the countries closer to the locations of the conflict (Afghanistan, Burundi, Iraq, Niger, etc.) receive more aid.

Going on to look at Arms Exported:

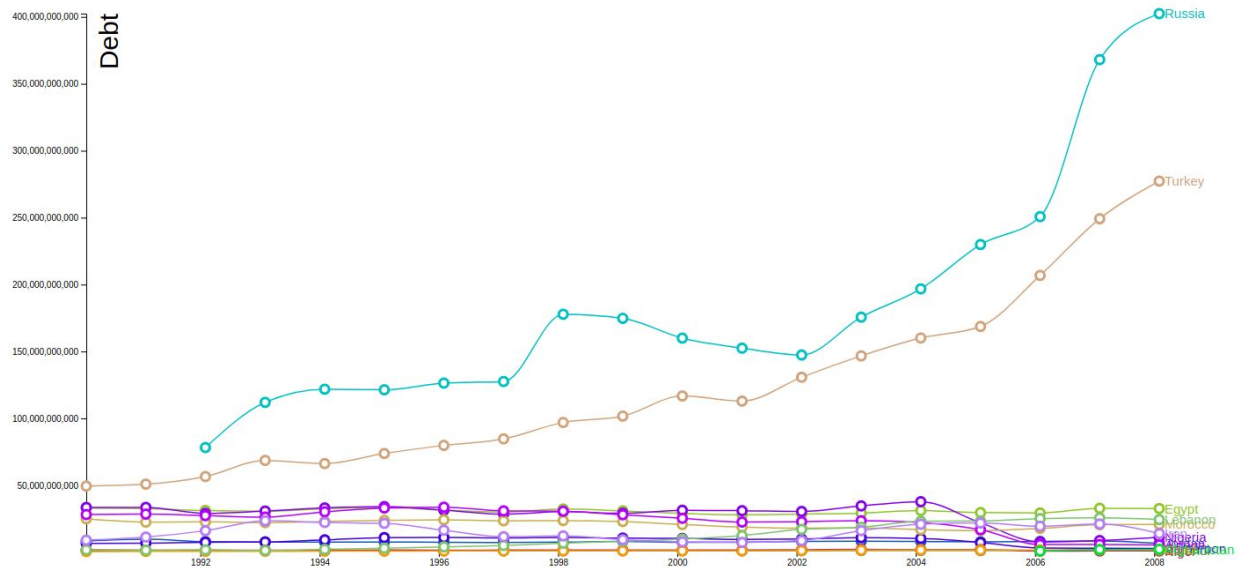

Two things are evident.

First: countries military involved but far away from the location (United States, Russia, Germany, France), make a lot more money on exporting weapons.

Second: A clear improvement on this graph would be filtering and rescaling the axis. Values for countries like United States and Russia dwarf the other countries so their values become hard to parse.

Lastly we look at how “Debt to foreigners by public & private (% of GNI)” looks like:

This didn't give that much information related to the conflict at hand. It's still interesting to see how far above the other countries Russia and Turkey are. A **very very** interesting fact here is that gapminder did not have debt-data on United States making this graph very misrepresenting (since USA is par with Russia for national debt)
